**CERTIFICATE OF MAILING**

I hereby certify that this correspondence is being deposited with the United States Postal Service as first class mail, postage prepaid, in an envelope addressed to: Commissioner for Patents, Washington, D.C. 20231, on this 15<sup>th</sup> day of November, 2004.

By:

  
Jonathan R. Sick  
Registration No. 43,920  
Attorney for Applicants

**DECLARATION UNDER 37 C.F.R. § 1.131**

Commissioner for Patents  
P.O. Box 1450  
Alexandria Virginia 22313-1450

Sir:

We, Roger Bernards, Hector Gonzalez, Al Kucera, and Mike Schanhaar, declare the following:

1. We are the applicants of the above-identified patent application and coinventors of the subject matter described and claimed therein.

2. Prior to the filing date of United States Patent No. 6,666,987 ("Morikawa"), which is June 8, 1999, we reduced to practice the idea of a process for preparing roughened copper surfaces comprising the steps of contacting with a clean copper surface an adhesion promoting composition under conditions effective to provide a

roughened copper surface, wherein the adhesion promoting composition consists essentially of hydrogen peroxide, a pH adjuster, a topography modifier, and a uniformity enhancer, and at least essentially free of halogen ions.

3. Prior to the filing date of Morikawa, we completed our invention as described and claimed in at least claim 1 of the present application, as evidenced by the laboratory notebook pages attached as Exhibit A.

4. The laboratory notebook pages are those of one of the undersigned applicants, Roger Bernards.

5. The first page (laboratory notebook page 29) describes the commencement of a multi-day experiment designed to develop a process for preparing roughened copper surfaces.

6. As shown on this page, a standard bath was used for each set of runs in the experiment. The standard bath contained:

- (a)  $\text{H}_2\text{O}_2$  (hydrogen peroxide),
- (b)  $\text{H}_2\text{SO}_4$  (sulfuric acid), and
- (c)  $\text{CuSO}_4$  (copper sulfate).

7. The run "sets" that follow on the first and subsequent pages describe additional components that were added to the standard bath prior to applying the composition to a copper surface.

8. Set "K" is described on page 34. The heading for Set K indicates the component that was added to the standard bath for this set of runs: "5 Amino Tetrazole •  $\text{H}_2\text{O}$ ".

9. Set K consists of 13 runs. Each run lists the concentration of 5-aminotetrazole added to the standard bath, plus any additional components that were added. Run 4 lists: ".5 g/L + 1.5 g/L BTA". BTA is an acronym for benzotriazole. In run 4, therefore, 0.5 g/L of 5-aminotetrazole and 1.5 g/L of benzotriazole were added to the standard bath.

10. Thus, the composition used in Run 4 of Set K contained the following components:

- (a) hydrogen peroxide,
- (b) a pH adjuster (sulfuric acid),
- (c) a topography modifier (benzotriazole),
- (d) a uniformity enhancer (5-aminotetrazole), and
- (e) copper sulfate.

11. As explained on laboratory notebook page 34, the composition of Run 4 was successful when applied to a copper surface: "Dark and very uniform looks great" and "What's awesome about #4 and #9 and others on this page is that no matter how [expletive] the surface is before going into the etch you get complete coverage with no skip etch."

12. Each of the dates deleted from Exhibit A is prior to the filing date of Morikawa.

13. We certify that all statements made herein of our own knowledge are true, and that all statements made herein on information and belief are believed to be true. We understand that willful false statements and the like are punishable by fine or

imprisonment, or both (18 U.S.C. 1001) and may jeopardize the validity of the application or any patent issuing thereon.

Objective To make a dark coating with Cobra band + additives other than BTA

Standard Bath:  $H_2O_2$ : 3% Temp 98°F (from 5%  $H_2SO_4$  add)  
 $H_2SO_4$ : 5% 94°F - 97°F  
 $CuSO_4 \cdot 5H_2O$ : 40 g/L  
 $Cl^-$ : Zero unless listed  
 Additive: Variable

3-X Set A: Cobratec 928 — Material (5 only) 90% active (not taken into account for g/L)

		Gross	Tare	Dwell (min)	Etch	Appearance
{ 1)	1 g/L	1.5870	1.5159	1:10	80.5	Slightly darkened
{ 2)	3 g/L	1.5916	1.5326	1	67	Lighter but cool looking
{ 3)	5 g/L	1.5671	1.5165	1	57	same
{ 4)	7 g/L	1.5607	1.5148	1	52	same
{ 5)	10 g/L	1.5372	1.4891	1	54	same
{ 6)	15 g/L	1.6355	1.5866	1	55	may be not as rough
{ 7)	25 g/L	1.6315	1.5857	1	52	may be not as rough
{ 8)	0.5 g/L	1.5764	1.5172	1	67	not as rough looking

3-X SET B Cobratec PT (The PT Solution has 10%  $H_2SO_4$ )

{ 1)	1 g/L	1.5997	1.5328	1	76	looks very smooth
{ 2)	1 g/L (active material)	1.5956	1.5520	1	49	Striations on top side Bottom side looks not etched
{ 3)	2 g/L					
{ 4)	2 g/L Repeat	1.6062	1.5338	1:20	82	Striations
{ 5)	2 g/L + 5 g/L $Cl^-$	1.6068	1.5995	1:20	8.3	No etch
{ 6)	3 g/L	1.5963	1.5225	1:20	84	Striations Big time
{ 7)	4 g/L	?	1.5388	1:28	80	Striations
{ 8)	4 g/L	1.5921	1.5288	1:20	72	"
{ 9)	5 g/L	1.6065	1.5355	1:20	80	"
{ 10)	7 g/L	1.5990	1.4924	1:20	121	"
{ 11)	10 g/L	1.5701	1.5211	1:00	55	"
{ 12)	15 g/L adjusted for $H_2SO_4$	1.5791	1.4745	1:50	118	"
{ 13)	1.5 g/L	1.6021	1.5227	1:20	90	nonuniform thin marker
{ 14)	2.5	1.5961	1.5071	1:20	101	Striations Fat marker

The main conclusion drawn from the testing of the many additives from pages 27-47 can be found on pg 34. From ~~Set K~~ <sup>(Set K)</sup> ~~The~~, see the note entered on that page. The 5 Amino tetrazole acts as a uniformity enhancer if it is in the right concentration and if it is in the right ratio with the BTA. This is a big improvement over the BTA only system and may be patentable. Further testing by others at electrochemicals [See Al Kucera's, Hector Gonzales' and Mike Schanhaar's Notebooks] also show that the 5 amine tetrazole acts as a uniformity enhancer. i.e. the panels look more uniform in color, degree of etch, <sup>and</sup> coverage of the coating when the 5 amine tetrazole is used in conjunction with the BTA. Also the 5 amine tetrazole when used as the sole additive is not as uniform as when used in conjunction with the BTA. On pg. 34 #4 is definitely better than #1 as ~~was~~ was noted when I ~~said~~ wrote #4 "looks great." The optimum Ratio of BTA to 5 amine tetrazole is close to 3 to 1 and the best concentration of BTA is close to 1.5g/l and the best concentration for 5 amine tetrazole is <sup>close to</sup> 0.5g/l. The  $H_2O_2$ ,  $H_2SO_4$ , Temp., Copper (copper can be zero, copper is not needed to make this formulation work properly), Concentrations can vary a lot but I think  $H_2O_2$  = .2% - 5%,  $H_2SO_4$  .1% - 8%, and Temp 60°F - 130°F is the best range. Most commonly  $H_2O_2$  = 1% - 2%,  $H_2SO_4$  4-6%, and Temp 80-100°F is employed.
